Response stage of disaster management

What are the four phases of disaster response. What is response in disaster management. What are the three stages of disaster response.

The premise behind the four phases of emergency management is to reduce the impact of emergencies on individuals and communities through adequate preparedness and response. Governments, schools and other agencies are adopting emergency management plans that include these four steps and ensure that they have comprehensive plans to address the impact of emergency situations. A list of resources on planning and responding to emergencies is provided at the bottom of the page. Phase 1 - Prevention / Mitigation This describes the activities designed to reduce or eliminate the chance of a disaster and to reduce the vulnerability of individuals and communities to the negative impacts of a disaster. The mitigation and prevention seek to reduce the cycle of disaster damage and are generally intended for long-term sustained effect. Step 2 - Preparation This is the process of personal identification, training and equipment necessary for a wide range of potential accidents and develop specific plans for jurisdiction for the delivery of functionality when needed for an accident. This phase is an ongoing process that involves the efforts at all levels of government and between government and private organizations and NGOs to identify threats, determine vulnerabilities and identify resources. Step 3 - The response of the response activities following an emergency or disaster and are generally designed to provide emergency assistance to victims (for example, search and rescue, emergency shelter, medical care, mass feeding). Response activities are focused on the short-term need, but also try to reduce the likelihood of secondary damage resulting from the emergency situation (for example, turning off resources for supplying contaminated water or patrol an area with high risk of looting or community violence). Step 4 - Recovery These activities represent a comprehensive approach to restore the environment by addressing the social, environmental, political and economic of the community. These activities start up immediately after the response phase, or simultaneously with the final aspects of that phase. Contingency two levels of activity: (1) short-term recovery to restore vital life support systems to minimum operating standards and (2) long-term recovery activities which may persist for several years after a disaster and try to restore life to improve or functional levels. Resources The availability and emergency management for schools The Technical Support Center has a number of resources, training courses, distance learning events and list of funding opportunities on their website. Here are some below which are particularly relevant for schools: Emergency management school online courses Practical information on the planning of the crisis: a guide for schools and the Guide to Community for evaluations of school vulnerability assessments of threat threat assessment in schools : a guide to handle threatening situations and creating a safe school climates Tips to help students recover from traumatic events emergency management concerns the management of risks to communities and the environment. It is the core business of the emergency services, but every individual and organization has a part to play. The emergency management affects the response and recovery of the preparation of the preparation. Leaders in organizations need to know their roles and responsibilities in each phase of the emergency management cycle and lead their organization through them. Prevention of the emergency management cycle Actions taken in advance. Sometimes this is referred to as The examples include the rear combustion or the construction of sea walls to protect from tidal waves, with alternative sources of electricity or alternative communication systems in
